

# Where are our Nanoparticles?

At site and *in situ* monitoring

Deborah Oughton and WP6/8/10

UNIVERSITÄT  
DUISBURG  
ESSEN

NanoRem Final Conference  
Nanoremediation for Soil and Groundwater Clean-up  
- Possibilities and Future Trends

Frankfurt am Main, 21<sup>st</sup> November 2016

# Overall WP objectives

- ..the development and application of analytical methods and protocols for in-situ measurement, detection and studies of the fate of nanoparticles.

Taking Nanotechnological Remediation Processes  
from Lab Scale to End User Applications  
for the Restoration of a Clean Environment

Project Nr.: 309517  
EU, 7th FP, NMP.2012.1.2

WP 6: Analytical Methods for *In-situ* Determination of  
Nanoparticles Fate.

DL 6.1 Feasibility and Applicability of Monitoring  
Methods

Deborah Oughton (NMBU), Melanie Auffan (CERGE), Steffen Bleyl (UFZ), Julian Bosch (HMGU), Jan Filip (UPOL), Norbert Klaas (USTUTT), Jonathan Lloyd (UMAN), Frank van der Kammer (UNIVIE).

March 31<sup>st</sup> 2015

The research leading to these results has received funding from the  
European Union Seventh Framework Programme (FP7/2007-2013)  
under Grant Agreement n° 309517

# Analytical Toolbox

## WP 2 and 3

- Particle Characterisation

## WP4

- Laboratory test of methods
- Tracing techniques

## NanoRem Analytical Toolbox

## WP8/10

In situ and at site monitoring

## WP5

- Characterisation of test media

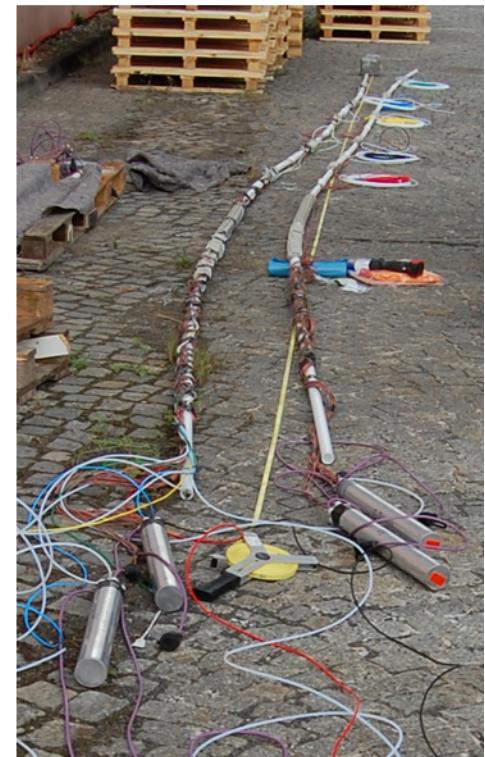

Where are our Nanoparticles

NanoRem Final Conference, 21<sup>st</sup> November 2016

# At site and *In situ* measurement

- Definition of *in situ* measurement. In principle, a true *in situ* measurement means putting the measuring device in the aquifer. At present, only magnetic susceptibility, and possibly some of the redox/H<sub>2</sub> methods would qualify. But field methods can also make use of a range of *in situ* sampling techniques. The approach means that we can study the particles' behaviour *in situ* rather than relying on laboratory studies.
- Need to see all methods as complimentary; there is no one method that can answer all questions, at all sampling points.

Field arrays VEGAS

Where are our Nanoparticles

NanoRem Final Conference, 21<sup>st</sup> November 2016

# For All Field Sites: Data Needs at Different Phases

1. Field characterisation studies prior to injection
2. Monitoring the movement and distribution of particles during injection. Is the particle suspension reaching the required location, with the required concentration and state?
3. Monitoring for transport of “fine” or “renegade” particles out of the core application area during and after injection. Low NP concentrations give rise to challenges with detection against background levels of colloids.
4. Post injection behaviour. Transformation and reactivity of the particles. Need for reinjection.

Where are our Nanoparticles

NanoRem Final Conference, 21<sup>st</sup> November 2016

# Case study: Usti II - distant wells

No detectable Nano-goethite (<1 mg/L)

Where are our Nanoparticles

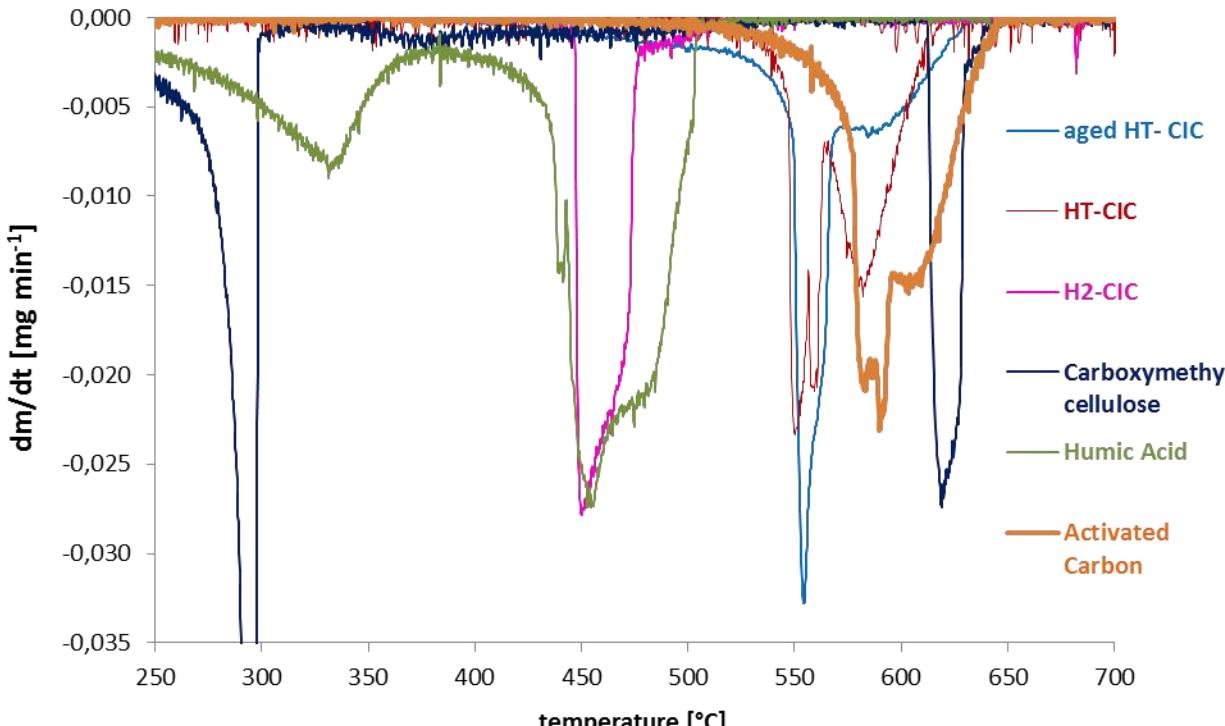

NanoRem Final Conference, 21<sup>st</sup> November 2016

# What works for Carbolron?

Temperature-programmed oxidation (TPO) coupled with IR gas analysis (TPO-IR)

- Lab and field tests indicate LOD at 0.03% wt in sediments

Core samples from  
Balassagyarmaat field site

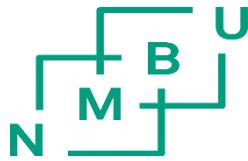

TPO of carbonaceous materials in a  
thermogravimetric balance

Where are our Nanoparticles

NanoRem Final Conference, 21<sup>st</sup> November 2016

# Highlights

- Magnetic susceptibility arrays successfully tested for *in-situ* monitoring of nZVI - Nanofer STAR, Nanofer 25S - and milled Fe -FerMEG12. (€1000 per array, detection limits g/L Fe)
- Variety of techniques applicable for simple on site tracing of Fe-based NPs – redox, Fe/Fe<sup>2+</sup>, turbidity (€10's per sample; mg-g/L)
- Multi-elemental fingerprinting developed and tested at different NanoRem field sites (€2000- €10000 for monitoring renegades; µg-mg/L)
- New methods developed and tested for Carbo-Iron®
